

# Python Programming

---

Department of Computer Science & Engineering

# CHAPTER-1

## Basics

# Why You Should **LEARN PYTHON** Right Now

# What is Python?

- High Level Programming Language
- Shorter Language( 3-5 lines than java, 5-10 lines than c++)
- Since 1991, consistently in top 10 most popular computing language

Image source : <https://www.nicepng.com/>

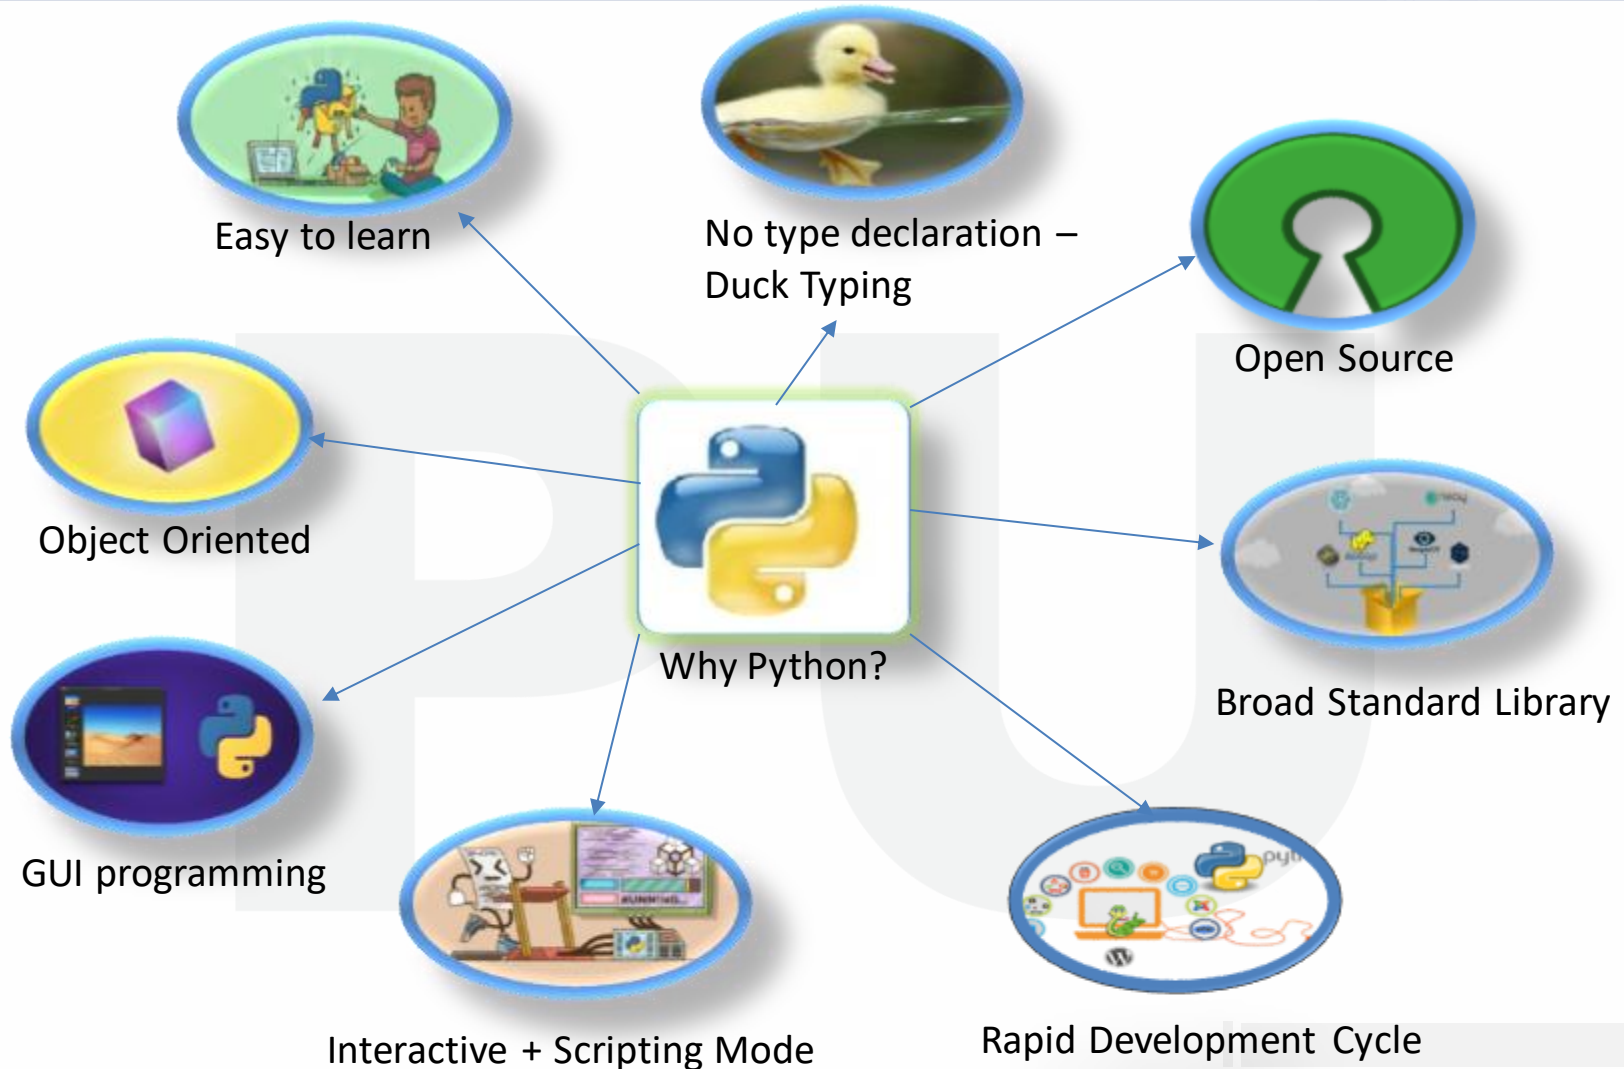

## History

- Invented in the Netherlands, early 90s by Guido van Rossum
- Named after Monty Python
- Open sourced from the beginning
- Managed by Python Software Foundation

## Moral of the Python Story

## Reserved Words

- Reserved Words can not be used as identifiers name

Python has 31 keywords<sup>1</sup>:

and	del	from	not	while
as	elif	global	or	with
assert	else	if	pass	yield
break	except	import	print	
class	exec	in	raise	
continue	finally	is	return	
def	for	lambda	try	

# Identifier

➤ A name given to identify variables, user defined function, class and object

## ➤ Rules

1. Must start with letter or underscore
2. Must contain only letters, numbers or underscores
3. Case sensitive
4. Keywords are not allowed

- ☐ **Valid:** `my_var` `_x` `var1`
- ☐ **Not Valid:** `my.var` `2x` `var$`
- ☐ **Different:** `My_var` `my_var` `x` `X`

Figure 1.2 Identifier Example

# Operators

- Required to perform an operation on variables

**Arithmetic Operators**

Operators	Name
+	Addition
-	Subtraction
*	Multiplication
/	Division
**	Power
%	Reminder
//	Integer division

Table 1.1 Arithmetic Operators

**Comparison Operators**

Operators	Name
==	Equal
!=	Not equal
>	Greater than
<	Less than
>=	Greater than or equal to
<=	Less than or equal to

Table 1.2 Comparison Operators

# Operators

**Logical Operators**

Operator	Operation
and	(x and y) is true if both x and y are true
or	(x or y) is true if either x or y is true
not	True value will become false

Table 1.3 Logical Operators

**Special Operators**

Operator	Operation
is	Returns true if identity of two operands are same, else false
is not	Returns true if identity of two operands are not same, else false
in	Returns True if a sequence with the specified value is present in the object
not in	Returns True if a sequence with the specified value is not present in the object

Table 1.4 Special Operators

# Python As Interactive Shell

- Get immediate output after typing one python instruction
- Python Installation:
  - Get latest python release(3.0 OR above) from official website

<http://www.python.org/download>

```
>>> print("Hello")
Hello
>>> 2**3
8
>>> 2/3
0.6666666666666666
>>> 2//3
0
>>> |
```

## Python As Script

- Write sequence of statements into file and tell python to execute it
- Python file uses extension as '.py'
- Execute your python file from command prompt with command :  
**'python hello\_world.py'**
- Create a script:
  - Open a file from your python idle 3.0
  - Write python statements
  - Execute file by choosing 'Run Module' or press F5

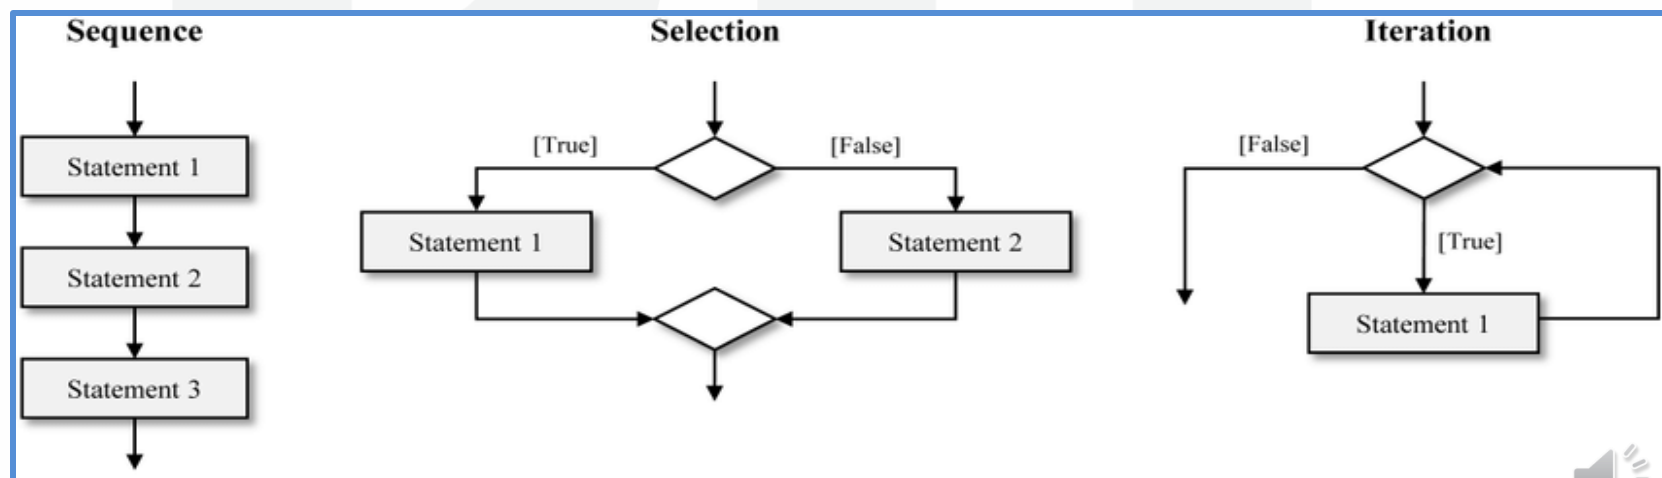

```
hello_world.py - C:/Users/Nita Jadav/AppData/Local/Programs/Python/Python36/hello_world.py (3.6.7)
File Edit Format Run Options Window Help
print("Hello World")
print(2+3)
```

Hello World  
5

# Code Flow in Python

- Python code is sequence of statements to perform task
- Some statements can be selective based on conditions
- Some statements can be iterative
- Some group of statements may be used again at different places

# Indentation in Python

➤ Line indentation used to identify block of code

```
n=input("Number:")  
i=0  
total=0  
while(i<n):  
    a=input("enter:")  
    total = total +a  
    i=i+1
```

While  
Block

## Comments in Python

- Statements ignored by python
- Use '#' sign to write comment
- Used to provide documentation to python statements

```
n=input("Number:") #To read value of n from user  
i=0  
total=0
```

Python comment
